Bridge Perfomance Testing

The tests here are performed with a slightly modified bridge. I added an array of times to both the JS side and the Native side to collect the important timings. Times are in milliseconds and are from the common system clock.

The data returning across the bridge was modified to include the native data size and times.

All times are recorded by logging the arrays of times after the exec call is completed and then post-processing the log a bit.

Because the times are handed back across the bridge, this still generates useful times if the calls are async. In the async case, the round-trip time does not necessarily mean that the gui thread was held up that long.

MobileSpec Sheet:

The mobilespec sheet just shows the times for a run of the mobilespec autotest-all tests.

Echo Sheet:

This shows a sample of times for different data sizes

Columns:

Plugin:	the plugin being called	Absolute time
Action:	the action requested of the plugin	Absolute time
Request Size:	the size of the packed data ready to go to the bridge	Absolute time
Response Size:	the size of the data ready to come back to JS	Absolute time
Data Type:	as used in the bridge to determine the data type	Absolute time
js exec start:	the very beginning of the exec call in js	Absolute time
js encode complete:	arguments packed up and ready to go	Absolute time
Native Start:	the very beginning of the native bridge code	Absolute time
Native plugin found:	after the plugin object is located	Absolute time
Native code complete:	plugin is done executing, plugin result being built	Absolute time
Native Encoded:	all packed up, going into the queue	Absolute time
js decode start:	back in js, unpacking results	Absolute time
js callback ready:	results unpacked, calling the callback	Absolute time
js encode	time required to encode parameters	elapsed time
js decode	time required to decode results	elapsed time
native encode	time required to encode results	elapsed time
js->native	total for encode and call to native	elapsed time
Native->js	total for encode and callback to js	elapsed time
Round Trip	Total for the exec all	elapsed time
Native Only	only the time spent in the plugin	elapsed time

Plugin	Action	Request Size	Response Size	Data Type	js exec start	js encode complete	native start	native plugin found	native complete	native encoded	js decode start	js callback ready	js encode	js decode	native encode	Total js_native	native_js	round-trip	native only

													27.59%	0.17%	7.24%	32.07%	7.41%		57.59%

In the tests, the largest single item in echo time is the conversion of a string argument to a JSONArray argument during the native->native plugin execute call. This shows up more with larger arguments, accounting for 57% of a 1MB call.

Plugin	Action	Request Size	Response Size	Data Type	js exec start	js encode complete	native start	native plugin found	native complete	native encoded	js decode start	js callback ready	js encode	js decode	native encode	js-native	native-js	round-trip	native only
